Abstract

Urban planning and management is one of the most important instruments in regard with realizing development of tourism. Hence, this issue has been formed of organization of factors, forces and sources for running affairs and meeting needs of residents of cities and includes functions such as planning, implementation, supervision and control. The main objective of the present study is codifying strategy of tourism planning in regional development with case study of Borujen City. Applied method in this study is a combination of descriptive analytical methods with applied orientation and statistical population of the study includes scholars and experts of Borujen City in field of tourism management, which the number achieved to 33 persons using snowball sampling method. Obtained results from the study indicate that strategic priorities of tourism planning in regional development of Borujen respectively from the lowest to highest position are as follows: introducing plant and animal habitats in regional and national level; using rich plant or animal ecosystems and preserved ranges under title of ecotourism in regional and national scale; utilizing experts and scholars for codifying relevant strategies of tourism industry.

Key words: strategy codification, tourism planning, regional development, Borujen City

1. Introduction

Today, tourism has been changed into an effective issue in world economy (Ibrahim Zadeh and Aghasi Zadeh, 2011). Based on published values and statistics by World Tourism Organizatio, it has been changed into the largest income source in the world (Liu et al, 201: 413; Tohidy, 2011: 207) and economists consider the phenomenon as the third dynamic and developing economic phenomenon after oil and automation industries (Madhushi and Naser Pour, 2003: 27). Tourism is one of the most important activities of contemporary people, which can change life of people through creating come basic changes in economic, cultural, political and environmental conditions. Tourism is a series of events and relations resulted from interaction between tourists,
capital, governments and host societies, universities and non-governmental organizations, transportation, receiving and controlling tourists and other visitors (Weaver and Opperman, 2000: 3).

Tourism takes action in specific spatial patterns. One of the mentioned spatial patterns is urban tourism. As urban spaces have many tourism attractions, they can be mostly considered as important tourism destinations. Usually cities include various and great attractions including museums, memorial buildings, theater halls, sport stadiums, parks, shopping centers, places with historical architecture and places related to important events or famous individuals, which can attract tourists (Mahmudian, 2014: 3).

Urban tourism is a complicated combination of different activities, which has been created from attachment of environmental specifications and ability of the city for attracting visitors and supplying services. The first condition for success of each city in development of tourism is existence of suitable urban infrastructures, integration of all relevant organizations and desirable management of political, cultural and social affairs. On the other hand, required conditions for development of tourism include combining urban attractions; sustainable use of tourism resources; creating facilities and equipment that can facilitate access to attractions; satisfaction of visitors and local control (Dinari; 2005: 15). In regard with realization of development of tourism, urban management and planning is the most important instrument. Hence, this issue has been formed of organization of some factors and resources for running affairs and meeting needs of urban residents and includes functions such as planning, implementation, monitoring and controlling affairs (Rezvani, 203: 50).

Hence, planning, guidance and development of tourism industry can be regarded as one of the most important resources of income and job creation, which has also extraordinary social, cultural and environmental impacts. However, conducting the process can be realized through scientific recognition of existing capabilities and bottlenecks in every region. Borujen city located in Chaha Mahal and Bakhtiari Province has had considerable development over the years. In summer of 2013, more than 6million tourists had visited Borujen City (Club of Newsmen, 2013). As the region can be developed in tourism industry because of including various tourism attractions, necessity of planning for development of the city and region with the objective of promoting tourism can be felt. Hence, the present study has considered this issue.

2. Theoretical literature
Fry and Stoner: strategic planning is a powerful management instrument designed for small firms, so that they can adjust themselves with predicted changes of the environment. Specifically, the process of strategic planning can present an analytical perspective of relevant firm and environment; can explain current conditions of the firm and can also identify effective key factors in success of the firm (Fry and Stoner, 1995: 12).

Lerner (2002): strategic planning is the process of constant and complicated organizational change. If the following specifications are combined with each other, they can define comprehensive and successful strategic planning. Strategic planning considers future and is concentration on the predicted future and considers this issue that the world after 5-10 years will have what difference with the current world. It is based on analysis of processes and predicted scenarios for possible options in the future and also based on analysis of input and output data. It
has also tendency for creating big image of future of the organization. It can adjust strategic planning of the organization with its environment; provides the conditions for achieving goals; provides a framework for the organization to achieve its desired future. It can provide a framework, through which potentials of the organization can achieve competitive advantage through analyzing the organization and internal and external environment of the organization. This issue enables the organization to show response to processes, events, challenges and opportunities through a framework from attitude and mission created by the strategic planning process. It is a theoretical and qualitative process. Strategic planning can combine soft data like experiences, intentions and ideas existing in daily discussions of the organization and takes action to present a clear attitude and organizational goal. It allows the organization to concentrate, since it is a dynamic and constant process of self-analysis activities. Constant learning process is in the process of the organization that can be developed more than achieving a series of predetermined goals. Strategic planning tends to change manner of thinking and acting in the organization to create a learner organization. When the planning is successful, all operational sectors would be affected and it would become a part of the philosophy and culture of the organization.

Puffer: strategic planning is the process of creating and developing essential procedures to achieve future. The author has considered difference between long-term planning that is reaction-based and strategic planning that allows the organization to create its future.

McKeon: strategic planning is a process for organizational renewal and transmission. In opinion of the author, long-term planning of goals and predictions is based on assumption of organizational sustainability; although in strategic planning, the role of the organization in it would be investigated. Strategic planning can enable the organization to adjust its activities and services for meeting changing needs. The planning can not only present a framework for improving plans, but also it can present a framework for reconstruction of plans, management and cooperation for evaluating progress of the organization in these fields (http://eric-web.tc.columbia.edu, 2002).

Comparing models of strategic planning of large and small organizations indicates that all of them include three steps including determining the mission; internal and external analysis and determining strategies of the company. Although some of them have more steps and priority of them is different from arrangement of the three mentioned steps; they can be classified in the three steps. Generally, the steps can be observed in all models. In the organizations that their mission has been determined previously, the two latter steps are basic steps for determining strategy.

3. Literature

For 20 years, strategic planning in Iran has been started and has been developed over the 15 years. Familiarity of managers with strategic planning on one hand, and continuing evolutions in Iran after imposed war on the other hand could increase interest of the organizations for codifying strategies.

Many organizations have set strategic plans; although the plans have been rarely implemented in like other strategic plans in other regions of the world. As a result of lack of implementation of strategic plans, effectiveness of the important managerial activity has not been desirable in Iranian organizations (Anvari et al, 2013).
Among modes of strategy codification, SWOT model is the most efficient model for codifying strategy of tourism industry (Bahrami, 2010). The most important strategic plan set in Iran country has been strategic planning set in regard with Iran's 2014 perspective. Other relevant studies in this field include development of tourism of Qom through emphasizing religious tourism (Ibrahim Zadeh et al, 2011); using MS-SWOT model for analyzing tourism management in Mashhad Metropolis (Mafi and Saghayi, 2009); analysis of effective factors in development of tourism in coastal zone of Chabahar using SWOT strategic model (Ibrahim zadeh and Aghasi Zadeh; 2009).

Among foreign works, one can name studies including study of Subramoniam (2010), who has analyzed Oman tourism using SWOT model and study of Takano (2009), who has used combined model of SWOT-AHP for strategic planning of tourism marketing of Sri Lanka.

4. Studies area
Borujen city is located in central part of Borujen. Population of the city has been equal to 52694 based on statistics of 2011. The city includes historical and ancient works such as "Saghakhanah of the region; door of caravanserai"; "Haj Suleiman Mosque"; "Big Mosque of Nagheh"; "Hafizi Home"; Ma'more Church; Maktabkhaneh Bathroom and Bazaar Bathroom and many other phenomena before and after the date. The city also includes tens tourism and religious centers and abundant handy crafts. It includes also mild cold climate with hot and dry summers.

![Figure 1: location of Chahar Mahl and Bakhtiari province and Borujen City on the map](image)

5. Methodology
In terms of objective, the present study is an applied-advanced study and the methodology applied in this study is descriptive-analytical method. At the present study, weighting method has been applied, which has been implemented using matrix of evaluating internal and external factors, based on which weight of each factor would be between 0 and 1 based on significance and sensitivity of the factor ad rank of each factor would be also an integer between 1 and 4. Effective factors in urban tourism of Borujen have been gathered and have been classified using...
library studies and interviewing with relevant experts in 4 ranges of opportunity, threat, power and weakness.

Powers and weaknesses:
Rank 4: excellent power
Rank 3: ordinary power
Rank 2: ordinary weakness
Rank 1: critical weakness
Opportunities and threats:
Rank 4: excellent opportunity
Rank 3: ordinary opportunity
Rank 2: ordinary threat
Rank 1: critical threat

Finally, the mentioned factors were weighted using ideas of experts. Number of relevant experts was 25 persons, which was continued using snowball technique to an extent that no other expert could be introduced.

6. Results

Table 1: results of analysis of external factors (opportunities)

<table>
<thead>
<tr>
<th>Opportunities</th>

7. Discussion and conclusion
Today, for purpose of utilizing long-term benefit from tourism industry, people need having strategic view to the industry and long-term planning. Accordingly, in regard with making field for realization of tourism development strategy in provinces, the present study has been conducted with the aim of identifying internal factors and external factors and codifying strategy
of tourism development in Borujen City. Using evaluation matrix of internal and external factors, power and weakness points and threats against tourism industry of the city have been listed and weighted.

Strategic priorities of tourism planning in regional development of Borujen city respectively from highest to lowest level include introducing plant and animal habitats in regional and national level; using rich plant or animal ecosystems and protected ranges under the title of ecotourism in national and regional scale; utilizing experts for codifying relevant strategies of tourism industry. The first strategy is in consistence with study of Takano (2009) for strategic planning of tourism marketing in Sri Lanka and study of Kazemi et al (2013) for codifying and selecting strategy of tourism development in Lorestan province. Findings of study of Eftekhari (2006) about development of tourism in Small Lavasan, study of Shahidi et al (2009) and study of Subramoniam (2010) about Oman's tourism have supported findings of the present study.
